

CS 5/7350 – Test 1
March 8, 2023

Name: Bingying Liang

- This exam is **closed book** and **closed notes**.
- Only the approved TI-30Xa calculator
- No cell phones, or other electronics.
- Pencil and/or pen only are permitted.
- Two Scratch Pages are on the back.
- It is **3 hours** in duration.
- You should have 15 problems. Pay attention to the point value of each problem and dedicate time as appropriate.

On my honor, I have neither given nor received unauthorized aid on this exam.

SIGNED: Bingying Liang

DATE: 03.09.2023

Name: Bingying Liang

ID: 4899 9397
[+5 pts CS-5350]

3

1. [5 pts] Circle the asymptotically larger function OR circle both if they are the same.

a. $f(n) = 2n$ and $g(n) = 8n$

b. $f(n) = 2^n$ and $g(n) = 3^n$

c. $f(n) = n!$ and $g(n) = n^n$

d. $f(n) = n^2$ and $g(n) = n^3$

~~e. $f(n) = \lg(n^2)$ and $g(n) = \lg(n^3)$~~

f. $f(n) = n!$ and $g(n) = (n+1)!$

g. $f(n) = \log_{10} n$ and $g(n) = \log_2 n$

~~h. $f(n) = \lg(2^n)$ and $g(n) = n$~~

~~i. $f(n) = \lg(n!)$ and $g(n) = n \lg(n)$~~

~~j. $f(n) = \lg(2^n)$ and $g(n) = \lg(3^n)$~~

8b

6

2. [6 pts] Argue that the problem, S, of sorting an unsorted array of integers is at least as hard - and maybe even harder - than the problem, M, of finding the minimum element of the same unsorted array of integers.

Sol: Since we can use a solver of problem S to sorting an unsorted array of integers, and use the solver to solve problem M to find the minimum element. Therefore, problem S is as least as hard and maybe even harder than the problem M.

7

3. [5 pts] Using n_0 equal to 100, find the tightest C_1 and C_2 to show that $f(n) = 7n^2 + 4n + 7$ is $\Theta(n^2)$.

Sol: $\Omega(n^2)$: $0 \leq c_1 g(n) \leq f(n), \forall n \geq n_0$

$0 \leq c_1 n^2 \leq 7n^2 + 4n + 7, \forall n \geq n_0$

$c_1 \leq 7 + \frac{4}{n} + \frac{7}{n^2}, \forall n \geq 100$

$c_1 \leq 7 + \frac{4}{100} + \frac{7}{100^2}$

$\Rightarrow c_1 \leq 7 + 0.04 + 0.0007$
 ≤ 7.0407

$O(n^2)$: $0 \leq f(n) \leq c_2 g(n), \forall n \geq n_0$

$0 \leq 7n^2 + 4n + 7 \leq c_2 n^2, \forall n \geq n_0$

$\frac{7n^2 + 4n + 7}{n^2} \leq c_2, \forall n \geq 100$

$7 + \frac{4}{n} + \frac{7}{n^2} \leq c_2$

$7 + \frac{4}{100} + \frac{7}{100^2} \leq c_2$

$\Rightarrow 7.0407 \leq c_2$
 $\therefore c_1 = c_2 = 7.0407$
 $\therefore \Theta(n^2)$

b

4. [8 pts] Consider the following graph:

- a) Give a Smallest Last Vertex Ordering for the graph where the terminal clique is the largest complete subgraph. Circle the vertex you removed first in your ordering.

1	0	1	2	3	1	2	2	3	2	2	<div style="border: 1px solid black; border-radius: 50%; padding: 5px; display: inline-block;"> 1 M </div>
1	C	B	G	F	N	D	E	A	H		

the largest complete subgraph
removed first

- b) Give a Smallest Last Vertex Ordering for the graph where the terminal clique is not the largest complete subgraph. Circle the vertex you removed first in your ordering.

0	1	2	2	2	3	3	2	2	<div style="border: 1px solid black; border-radius: 50%; padding: 5px; display: inline-block;"> 1 M </div>
B	C	E	D	N	B	G	A	H	

Not the largest complete subgraph
removed first

- c) A smallest last ordering for a different graph has a terminal clique of size 15 and a largest degree when deleted of 17.

- i. As an upper bound, how many colors might be needed for coloring the graph?

18

- ii. As a lower bound, how many colors must be required for coloring the graph?

~~6~~

5. [6 pts] Consider the following graph: For any algorithms below requiring a starting vertex, use vertex H

- a) What is the value of the third edge chosen when computing the minimum spanning tree with Kruskal's Algorithm

2 : BM ; DE

8+1 = 3

3 : BH

- b) What is the value of the third edge chosen when computing the minimum spanning tree with Prim's Algorithm

18B = 4

- c) What is the value of the minimum spanning tree.

$$2 + 2 + 3 + 4 + 5 + 5 + 7 = 4 + 7 + 10 + 7 = 11 + 7 = 18$$

- d) You want to find the shortest path from vertex H to all other vertices. What is the order you reach the other vertices using Dijkstra's Single Source Shortest Path algorithm?

0 3 5 7 8 13 18 18 19
H B M G C F E D

6. [6 pts] Describe how you could write an algorithm which uses Dijkstra's Single Source Shortest Path algorithm as a building block to find the shortest path between all pairs of vertices in the graph above.

For each vertex in Graph:
dist = 0

WHILE (pairs not empty)

For each neighbor

if dist < current

dist = current

If Dijkstra's Single Source Shortest Path algorithm had an asymptotically bounded running time of $\Theta(f(n))$, what is the running time of your algorithm?

$\Theta(n^2)$

15
7. [15 pts] Consider three different implementations that each solve a different problem.

- Implementation X solves Problem Px and Implementation X is $\Theta(n)$
- Implementation Y solves Problem Py and Implementation Y is $\Theta(2^n)$
- Implementation Z solves Problem Pz and Implementation Z is $O(n^2)$
-

Determine if each of these "Yes it is true", "Maybe it is true but doesn't have to be", or "No it is not true"

- Maybe Problem Py is harder than Problem Px
- Yes Implementation Y is harder than Implementation X
- Maybe Problem X is $\Omega(n)$
- No Problem X is $\omega(n)$
- Yes Problem Z is $O(n^3)$
- Yes Problem Z is $O(n^2)$
- Maybe Problem Y is $O(n)$
- Maybe Problem X is $o(n)$
- Yes Implementation X is $\Omega(n)$
- No Implementation X is $\omega(n)$
- Yes Implementation X is $O(n^4)$
- Maybe Implementation Z is $O(n)$
- Yes Implementation Z is $O(n^3)$
- Maybe Implementation Z is $\Omega(n)$
- No Implementation Y is $O(n)$

6

8. [6 pts] Answer the following questions:

- a) What is the maximum flow between two vertices for a complete graph with $|V|$ vertices where all edges have a weight of w ?

$$(|V| - 1)w$$

- b) What is the maximum flow between two vertices for a tree with $|V|$ vertices where all edges have a weight of w ?

$$w$$

- c) A complete bi-partite graph $B_{j,k}$ is a graph which has j vertices in one partition and k vertices in another partition and all possible edges present between the partitions. What is the maximum flow between the two partitions for a complete bi-partite graph $B_{j,k}$ where all edges have a weight of 3?

$$3(j \times k)$$

- d) What is the weight of a minimum spanning tree for a connected bi-partite graph $B_{j,k}$ where all edges have a weight of 3?

$$3(j + k - 1)$$

W

9. [4 pts] Two people need to establish a secret key for encrypting communications. They agree to use a Diffie-Hellman key exchange with a modulus of 11 and decide on 2 as the base. Person A chooses a random value performs the appropriate computations and sends the value 4 to person B. Person B chooses a random value of 5 and performs the appropriate computations:

- a. What is the value Person B sends to Person A

$$10$$

Person A	base 2	mod 11	Person B
4			5
$2^4 \% 11 = 5$		\longrightarrow	
		\longleftarrow	$2^5 \% 11 = 10$
			$3^2 \% 11 = 10$

- b. What is the shared secret key between Person A and Person B

$$5^5 \% 11 = 3 \quad 125 \% 11 = 1$$

10. [8 pts] Consider a Huffman encoding of the following string.

20 A's, 20 B's, 7 D's, 7 E's, 4 F's, 2 G's, 1 H and 1 K.

How many bits are in the entire message if each symbol is encoded with 3 bits?

$$(20 + 20 + 7 + 7 + 4 + 2 + 1 + 1) \times 3 = (40 + 14 + 6 + 2) \times 3 = (54 + 8) \times 3 = 62 \times 3 = 186 \text{ bits}$$

Create a Huffman encoding of the bits for each symbol:

How many bits are in the entire Huffman coded message?

$$20 \times 2 + 20 \times 2 + 7 \times 3 + 7 \times 3 + 4 \times 3 + 2 \times 4 + 1 \times 5 + 1 \times 5 = 40 + 40 + 21 + 21 + 12 + 8 + 5 + 5 = 80 + 42 + 20 + 10 = 152 \text{ bits}$$

How much entropy is in the entire message?

$$\text{Total} = 20 + 20 + 7 + 7 + 4 + 2 + 1 + 1 = 62$$

$$P_A = \frac{20}{62} = \frac{10}{31} \quad P_B = \frac{20}{62} = \frac{10}{31} \quad P_D = \frac{7}{62} \quad P_E = \frac{7}{62} \quad P_F = \frac{4}{62} = \frac{2}{31} \quad P_G = \frac{2}{62} = \frac{1}{31} \quad P_H = \frac{1}{62} \quad P_K = \frac{1}{62}$$

$$\begin{aligned} \text{Entropy} &= 20 \log_2 \frac{1}{P_A} + 20 \log_2 \frac{1}{P_B} + 7 \log_2 \frac{1}{P_D} + 7 \log_2 \frac{1}{P_E} + 4 \log_2 \frac{1}{P_F} + 2 \log_2 \frac{1}{P_G} + \log_2 \frac{1}{P_H} + \log_2 \frac{1}{P_K} \\ &= 40 \log_2 \frac{31}{10} + 14 \log_2 \frac{62}{7} + 4 \log_2 \frac{31}{2} + 2 \log_2 31 + 2 \log_2 62 \\ &= 65.29072862 + 44.05577944 + 15.81678524 + 9.908392621 + 11.90839262 \approx 146.98 \text{ bits} \end{aligned}$$

$$\bar{\Phi}(p-q) = (p-1)(q-1)$$

$$\bar{\Phi}(1 \times 5) = \bar{\Phi}(1) = 0$$

11. [6 pts] Answer the following Questions:

6

a. Compute $\Phi(31 \times 29)$ 840

b. Compute $11^{\Phi(35879)} \% 35879$ 1

c. Compute $11^{\Phi(35879)+1} \% 35879$ 11

12. [7 pts] Answer the following Questions:

1

a. Given that $M > 100$ and $3^{31} \bmod M = 4$; Find $3^{32} \bmod M =$ 12

$$3^{31} \cdot 3^1 = 4 \times 3$$

b. Given that $M > 100$ and $3^{32} \bmod M = 4$; Find $3^{64} \bmod M =$ 16

$$3^{32} \cdot 3^{32}$$

c. How much entropy does an entire message with 50A's and 50 B's have?

$$100 \text{ bits}$$

d. How much entropy does an entire message with 100A's and 0 B's have?

$$0 \text{ bits}$$

$$20 + 10 + 5 + 5 = 40 \text{ bits}$$

e. How much entropy does an entire message with 20 A's, 10 B's, 5 C's and 5 D's have?

$$p_A = \frac{20}{40} = \frac{1}{2}$$

$$p_C = \frac{5}{40} = \frac{1}{8}$$

$$p_D = \frac{1}{8}$$

$$20 \log_2 2 + 10 \log_2 4 + 5 \log_2 8 + 5 \log_2 8$$

$$= 20 + 10 \times 2 + 5 \times 3 = 20 + 20 + 15 = 55 \text{ bits}$$

$$p_B = \frac{10}{40} = \frac{1}{4}$$

f. Compute $-7 \bmod 11$ 4

g. Compute $(\frac{1}{2}) \bmod 7$ 4

$$\frac{1}{2} \times 2 \bmod 7 = 1 \quad 2 \times 4 \bmod 7 = 8 \bmod 7 = 1$$

h. Compute $-(\frac{1}{2}) \bmod 13$ 6

$$-\frac{1}{2} \times 2 \bmod 13 =$$

$$-1 \bmod 13 = 12$$

$$2 \times 6 \bmod 13 = 12 \bmod 13 =$$

6

13. [6 pts] What is an algorithm?

An algorithm is step by step procedure to solve a problem in finite amount of time.

14. [6 pts] Answer the following questions.:

n
64 t
9

- a) A program requires 9 days to brute force attack a password of 64 bits. Since the running time is $\Theta(2^n)$ about how days would it take for the program to brute force attack a password of 128 bits?

6

$$\frac{2^{128}}{2^{64}} \times 9 = 2^{64} \times 9 \text{ days}$$

- b) A program requires 9 days to brute force attack a password of 64 bits. About how days would it take for the program to brute force attack a password of 128 bits if the running were $O(n^2)$ instead of exponential?

$$\frac{128^2}{64^2} \times 9 = \left(\frac{128}{64}\right)^2 \times 9 = 4 \times 9 = 36 \text{ days.}$$

6

15. [6 pts] A particular algorithm on a computer requires 3 seconds to process 50 items and is $\Theta(n^2)$. You want to process 4000 items. You have a choice to either use a computer that is 10 times faster (allowing it to process 50 items in 0.3 seconds) or use the same computer with a different algorithm that still processes 50 items in 3 seconds, but has a growth rate that is $\Theta(n)$.

sol.

Faster computer:

$$\frac{4000^2}{50^2} \times 0.3 = 6400 \times 0.3 = 1920 \text{ seconds.}$$

different algorithm:

$$\left(\frac{4000}{50}\right) \times 3 = 240 \text{ seconds}$$

\therefore The different algorithm is the faster choice for 4000 items.

- b) For what input sizes is the faster computer better?

sol. suppose input is n

$$\frac{n^2}{50^2} \times 0.3 < \frac{n}{50} \times 3 \quad \frac{n}{50} \times 0.1 < 1 \Rightarrow n < 500 \text{ items.}$$

\therefore when input sizes smaller than 500 items, the faster computer better.

- c) For what input sizes is the $\Theta(n^2)$ algorithm better?

① On the same computer, compare with $\Theta(n)$

$$\frac{n^2}{50^2} \times 3 < \frac{n}{50} \times 3$$

$$\frac{n}{50} < 1$$

$$n < 50 \text{ items}$$

When $n < 50$ items, $\Theta(n^2)$ better

② On the faster computer

same as b) $n < 500$ items.

③ if different algorithms both on faster computer.

$$\frac{n^2}{50^2} \times 0.3 < \frac{n}{50} \times 0.3$$

$$\frac{n}{50} < 1 \quad n < 50 \text{ items}$$

④ if the question wrong. mean $\Theta(n)$. Then $n > 500$ items.
